

# Brute force

[7, 1, 5, 3, 6, 4]

$$\text{max-profit} = \max(\text{max-profit}, a[j] - a[i])$$

Time complexity :  $O(n^2)$

Space complexity :  $O(1)$

# Optimised solution (Single pass approach)

- While traversing the array, keep a note of smallest element on left of current element

Intuition:  $x - y \uparrow$  when  $y \downarrow$   
 $\therefore x \rightarrow \text{curr\_elem}, y \rightarrow \text{left\_min}$

$a =$ 

7	1	5	3	6	4
---	---	---	---	---	---

$\text{left\_min} = \text{INT\_MAX}$   
 $\text{profit} = 0;$

7	1	5	3	6	4
---	---	---	---	---	---

↑

$\text{left\_min} = \infty$  or 7 ✓  
 $\text{Profit} = \underline{0}$  or  $(7-7)$

7	1	5	3	6	4
---	---	---	---	---	---

↑

$\text{left\_min} = 7$  or 1 ✓  
 $\text{profit} = \underline{0}$  or  $(1-1)$

7	1	5	3	6	4
---	---	---	---	---	---

↑

$\text{left\_min} = 1$  or 5 ✓  
 $\text{profit} = \underline{0}$  or  $(5-1)$

7	1	5	3	6	4
---	---	---	---	---	---

↑

left\_min = 1 or 3  
profit = 4 or (3-1)

7	1	5	3	6	4
---	---	---	---	---	---

↑

left\_min = 1 or 6  
profit = 4 or (6-1)

7	1	5	3	6	4
---	---	---	---	---	---

↑

left\_min = 1 or 4  
profit = 5 or (4-1)

Hence profit = 5

Time complexity  $\rightarrow O(n)$   
Space complexity  $\rightarrow O(1)$
